[Demir, H. 2016. Crab spider species of Eastern Mediterranean Region of Turkey – Part I (Araneae: Thomisidae). *Munis Entomology & Zoology*, 11 (1): 123-141]

ABSTRACT: This study is based on materials were collected from eastern Mediterranean region of Turkey between April-August in 2007-2009. A total of 18 species were recorded in the genus *Xysticus* belonging to of Thomisidae. The main aim of this study is to determine the presence of crab spider species in the research area. This work is the first attempt for this purpose.

KEY WORDS: Araneae, Thomisidae, *Xysticus*, fauna, Turkey.

The Turkish crab spider fauna is not well studied. The first reports were made by Kulczyński (1903), Nosek (1905), Roewer (1959), and Simon (1875, 1879, 1884, 1914). Demir (2008) listed 41 species of the genus *Xysticus*; subsequently some new records were added and the number of species known from Turkey is now 45 (Demir et al., 2009; Demir et al., 2010a,b; Demir, 2012). Nevertheless, it is impossible to say that the fauna of Turkey is fully investigated. It needs to be studied more comprehensively.

In this part faunistic data of 18 species belonging to genus *Xysticus* from the family Thomisidae are presented.

MATERIALS AND METHODS

In this study, the specimens were collected from eastern Mediterranean region of Turkey. The specimens were preserved in 70% ethanol. The identification was made by means of a SZX61 Olympus stereomicroscope. Examined specimens were deposited in the GUZM (Zoology Museum of Gazi University) and NUAM (Arachnology Museum of Niğde University).
